Team ID	xxxxxxx
Project Name	Rising Waters: A Machine Learning Approach to Flood Prediction
Maximum Marks	2 Marks

Customer Journey Map

Map the user's journey through the Flood Prediction System by identifying each stage of interaction, including user actions, system touchpoints, thoughts, feelings, process ownership, and opportunities for improvement to enhance the overall user experience.

Phase of Journey	Stage 1	Stage 2	Stage 3
Actions <i>What does the customer do?</i>	• Open the flood prediction application. • Enter rainfall and weather-related data. • Submit the prediction request.	• Wait for the model to process the data. • View the predicted flood risk. • Analyze the prediction result.	• Take preventive actions if flood risk is high. • Plan evacuation or resource allocation. • Continue monitoring weather conditions.
Touchpoint <i>What part of the service do they interact with?</i>	• Home page. • Input form. • Weather data fields.	• Prediction engine. • Machine learning model. • Result page.	• Prediction report. • Flood alert message. • Recommendation section.
Customer Thought <i>What is the customer thinking?</i>	• "I hope the system provides an accurate prediction." • "The interface should be simple to use." • "Will my data be processed quickly?"	• "Is the prediction reliable?" • "How likely is a flood in my area?" • "Can I trust this result?"	• "What actions should I take now?" • "Should I inform local authorities?" • "How can I reduce potential damage?"

Customer Feeling <i>What is the customer feeling?</i>	• Curious. • Hopeful. • Interested	• Anxious. • Concerned. • Relieved if risk is low.	• Confident if guidance is clear. • Prepared. • Safer due to early warning.
Process Ownership <i>Who is in the lead on this?</i>	• User • Flask Web Application • Data Input Module	• Machine Learning Model • Prediction Engine • Backend System	• User • Disaster Management Authority • Emergency Response Team
Opportunities <i>How can we improve this stage?</i>	• Add automatic weather data collection. • Improve input validation. • Simplify the user interface.	• Increase prediction accuracy. • Reduce response time. • Display confidence score and visual charts.	• Provide real-time alerts via SMS/Email. • Integrate live weather APIs. • Suggest evacuation routes and nearby shelters.
